

# Scout-EL

The management software for ICEBUTLERS

Scout-EL is the software to centrally manage all your ICEBUTLERS . You merely need to unpack the appliance, place it and plug it in. Scout-EL does everything else for you. With Scout-EL you can define the software images and the connections to the different servers on your ICEBUTLERS all over the world from a single Microsoft windows workstation .

A simple graphical interface allows you to organize your thin clients with Elux software into locations and groups. Every organizational unit or site of a company can be mapped with Scout-EL. Within the groups user profiles are defined . For each profile the administrator defines the software image and the connections the user needs. Changing a ICEBUTLER from one group to another can simply be done by Dragging and Dropping the system from one group into another.

The discovery function of the scout -EL finds every thin client with Elux software on the network examines it's network configuration en places it in a group. This group has predefined connections and images so that the ICEBUTLER can work instantly.

When the Scout-EL server is down the thin client uses the last centrally loaded profile and works without any restriction. Installing new releases of the software on Icebutlers can be done automatically by Scout-EL without any supervision.

Last but not least Scout-EL makes your software and hardware asset management very simple .
